                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (commissureless) polypeptide in contact with a cell expressing active Robo (roundabout) on its surface. The method comprises modulating the effective amount of Comm polypeptide in contact with the cell, where the amount of expressed active Robo is specifically modulated inversely with the modulation of the effective amount of Comm in contact with the cell. The method is used to modulate the amount of active Robo expressed on a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell. The method can be used to screen for agents that modulate Robo:Comm
interactions. This is particularly useful for modulating nerve cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                575

C (VCAM)/ICAM polypeptide which was used to determine regions of VCAM-1 cinvolved in recognition of VLA-4-expressing cells. Recombinant genes cenceding VCAM/ICAM (intracellular adhesion molecule) chimeras were produced by exclsing portions of the VCAM-7D and VCAM-6D cDNAs and Creplacing them with analogous regions of ICAM-1 using unique restriction endonuclease sites within the VCAM-1 cDNA, and PCR centraction continued as a site of ICAM-1 cDNA, and PCR continued fragments of ICAM-1 (see also 043578-84). Substitution of one continued contin

encoding VCAM/ICAM (intracellular adhesion molecule) chimeras were produced by excising portions of the VCAM-TD and VCAM-6D cDNAs and replacing them with analogous regions of ICAM-1 using unique restriction endonuclease sites within the VCAM-1 cDNA, and PCR generated fragments of ICAM-1 (see also Q43578-84). Substitution of the excised VCAM-1 regions was done to eliminate as much as possible structural distortions what would accompany deletion of one compared commains of the VCAM-1 molecule. ICAM-1 was chosen as a donor because it is also a member of the Ig superfamily and has the highest degree of amino acid homology to VCAM-1 among superfamily members. The N-terminal three domian of VCAM-1 among superfamily members. The N-terminal three domian of VCAM-1 support adhesion to VLA-4, and VCAM/ICAM-1 and VCAM/ICAM-2 in which most of the first domain has been replaced by ICAM-1, do not bind to the anti-VCAM-1 monoclonal antibody (MAb), 489. Therefore the epitope which binds to 489 must be situated This sequence represents a chimeric vascular cell adhesion molecule (VCAM)/ICAM polypeptide which was used to determine regions of VCAM-1 involved in recognition of VLA-4-expressing cells. Recombinant genes domain 1.

                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                  identification of genes responsive to a specific mechanical stress. The method comprises applying the mechanical stress to an organism (tissue or cells comprising bone cells), isolating the specific cellular fractions and extracting mRNA from them, and differentially analysing the mRNA in comparison with control samples. The method is used to identify genes whose expression is responsive to a specific stress. The identified genes are employed in determining risk associated with a physiological or disease state. The risk determination methods are used for testing a method stress to the control samples.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is obtained from a clustral X alignment with protein 608. Protein 608 was identified using the method of the invention after subjecting rat osteoblasts to mechanical stress. Expression of the 608 gene was found to be upregulated by about 3-fold in cells subjected to mechanical strain. The specification describes a method for the
                                                                                                                                                                                                                                                                  medicament for gene therapy. These medicaments, or genes identified by the method of the invention, are used for treating, preventing or controlling a physiological or disatte (especially osteoporosis obone density or other factors causing or contributing to osteoporosis its symptoms or other conditions involved in mechanical stress or its lack. The methods can also be used for advancing research or studies in

CC This sequence represents the human neural cell adhesion molecule (NCAM) CC amino acid sequence. NCAM is found in three forms, two of which are CC transmembrane forms, while the third is attached via a lipid anchor to CC the cell membrane. All three NCAM forms have an extracellular structure consisting five immunoglobulin domains (Ig domains). The Ig domains are CC consisting five immunoglobulin domains (Ig domains). The Ig domains are CC containing a peptide which binds to the NCAM Igl domain. The compound CC containing a peptide which binds to the NCAM Igl domain. The compound CC binds to NCAM Igl/Ig2 domains, and is capable of stimulating or promoting CC promoting the proliferation of NCAM presenting cells. The compound may be used in the treatment of normal, degenerated or damaged NCAM presenting CC cells. The compound may in particular be used to treat diseases of the CC central and peripheral nervous systems such as post operative nerve CC damage, traumatic nerve damage, impaired myelination of nerve fibres, CC disease, dementias, sclerosis, nerve degeneration associated with CC disease, dementias, disorders affecting the circadian clock or neurocular transmission and schizorbrania.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                               contains six potential N-glycosylation sites.

Comparison of VCAM1 and VCAM1b ((006688) revealed that they are virtually identical except for one significant difference: VCAM1b contains an insertion of 276 nucleotides near the middle of the coding region. These nucleotides encode 92 additional amino acids which form an extra domain of 84 amino acids situated between the end of VCAM1 domain 3 and the beginning of VCAM1 domain 4. This identification is designated domain 3B.

                                                                                                                                                                                                                        characteristic of a signal sequence. It is predicted that the N-terminal amino acid of the mature protein will be phenylalanine: The extracellular domain of the polypeptide is ca. 606 amino acids including the signal sequence and is followed by a hydrophobic transmembrane region of 22 amino acids. The protein possesses a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-DEC-1989;

                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                          in recognition of VLA-4-expressing cells. Recombinant genes encoding CVCAM/ICAM (intracellular adhesion molecule) chimeras were produced by excising portions of the VCAM-7D and VCAM-6D cDNAs and replacing them with analogous regions of ICAM-1 using unique restriction endomuclease with analogous regions of ICAM-1 using unique restriction endomuclease sites within the VCAM-1 cDNA, and PCR generated fragments of ICAM-1 could be a succeed vCAM-1 regions was done to eliminate as much as possible structural distortions that would accompany deletion of one or more domains of the VCAM-1 regions was molecule. ICAM-1 was chosen as a donor because it is also a member of the Ig superfamily and has the highest degree of amino acid homology to VCAM-1 among superfamily members. The N-terminal three consists of the VCAM-1 support adhesion to VLA-4, and VCAM/ICAM-1 and CAM-1, do not bind to the anti-VCAM-1 monoclonal antibody (MAD), and the process of the process of the situated in the companies.

A. Molecule type: protein
A. Résidues: 34-48 <TAN1>
C.Comment: This protein is uniquely and transiently expressed
C.Comment: This protein is uniquely and transiently expressed
C.Keywords: glycoprotein; transmembrane protein
F.1-33/Domain: signal sequence #status predicted <SIG>
F.34-588/Product: adhesion molecule SC1 #status predicted <ADF
F.500-523/Domain: transmembrane #status predicted <TRA>
F.500-523/Domain: transmembrane #status predicted <TRA>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   JH0506
adhesion molecule SC1 precursor - chicken
C; Species: Gallus gallus (chicken)

-!- TISSUE SPECIFICITY: MAY APPEAR AT THE SURFACE OF NEURAL CREST CELLS DURING THEIR EMBRYONIC MIGRATION. APPEARS TO BE LIMITED TO CELLS DURING THEIR EMBRYONIC MIGRATION. APPEARS TO BE LIMITED TO VASCULAR SMOOTH MUSCLE IN NORMAL ADULT TISSUES. ASSOCIATED WITH TUMOR PROGRESSION AND THE DEVELOPMENT OF METASTASIS IN HUMAN MALIGNARY MELANOMA. EXPRESSED MOST STRONGLY ON METASTATIC LESIONS AND ADVANCED PRIMARY TUMORS AND IS ONLY RAFELY DETECTED IN BENIGN MELANOCYTIC NEVI AND THIN PRIMARY MELANOMAS WITH A LOW PROBABILITY OF METASTASIS.
-!- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. CONTAINS 3 C2-LIKE AND 2 V-LIKE DOMAINS.

-!- FUNCTION: HOMOPHILIC ADHESION MOLECULE ASSOCIATED WITH CLIMBING FIBER AXONOGENESIS. SUPPORTS NEURITE EXTENSION.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- TISSUE SPECIFICITY: EXPRESSED IN A RESTRICTED POPULATION OF AXONS.

-!- TISSUE SPECIFICITY: EXPRESSED IN A RESTRO AXONS IN THE DORSAL FUNICULUS, MUDLINE FLOOR PLATE CELLS, AND MOTONEURONS. FOUND IN EPUTHELIA, CENTRAL NERVOUS SYSTEM, AND HEMOPOIETIC CELLS. EACH EPUTHELIA, CENTRAL NERVOUS SYSTEM, AND HEMOPOIETIC CELLS. EACH EPUTHELIA, CENTRAL NERVOUS SYSTEM, AND HEMOPOIETIC CELLS. EACH EPUTHELIA, CENTRAL NERVOUS SYSTEM, AND HEMOPOIETIC CELLS. EACH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         587
                                                                  TISSUE SPECIFICITY: PRESENT ON ALL RETINAL GANGLION CELLS AND THEIR AXONS (IN EMBRYO). ABSENT FROM MATURE AXONS ALO OF THEIR LENGTH, BUT IS PRESENT ON NEW AND GROWING AXONS FROM THE RGCS AT THE RETINAL MARGIN. REMAINS ON ADULT RGC CELL-CELL COMPACT SITES AND IS CONTINUOUSLY FOUND IN THE AXON TERMINAL ARBOR LAYERS OF THE ADULT TECTUM.

SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY. CO 3 C2-LIKE AND 2 V-LIKE DOMAINS.
                                                                                                                                                                                                                                           FUNCTION: CELL ADHESION MOLECULE. INVOLVED IN NEURONS VIA HETEROPHILIC AND HOMOPHILIC INTERASUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
TISSUE SPECIFICITY: PRESENT ON ALL RETINAL GAN TRANSPORTER OF THE PROPERTY OF THE PROPERTY AND THE PROPER
